TREATING YOUR INFECTION - URINARY TRACT INFECTION (UTI)

For women under 65 years with suspected lower urinary tract infections (UTIs) or lower recurrent UTIs (cystitis or urethritis)

Possible urinary signs & symptoms The outcome Recommended care Types of urinary tract infection (UTI) Key signs/symptoms: All women: Self-care and pain relief UTIs are caused by bacteria getting into your urethra Dysuria: Burning pain when passing urine (wee) If none or only one of: dysuria, Symptoms may get better on their own or bladder, usually from your gut. Infections may occur **New nocturia:** Needing to pass urine in the night new nocturia, cloudy urine; in different parts of the urinary tract. Delayed or backup prescription with Cloudy urine: Visible cloudy colour when passing urine AND/OR vaginal discharge self-care and pain relief Kidneys (make urine) UTI much less likely Other severe signs/symptoms: Start antibiotics if symptoms: Infection in the upper urinary tract You may need a urine test to check for a UTI Frequency: Passing urine more often than usual Get worse • Pyelonephritis (pie-lo-nef-right-is). Antibiotics less likely to help Urgency: Feeling the need to pass urine immediately Do not get a little better with Not covered in this leaflet and Usually lasts 5 to 7 days Haematuria: Blood in your urine self-care within 48 hours always needs antibiotics Suprapubic pain: Pain in your lower tummy Non-pregnant women: **Immediate** antibiotics prescription Bladder (stores urine) Other things to consider: plus self-care If 2 or more of: dysuria, new nocturia, Infection in the lower urinary tract Recent sexual history cloudy urine; OR bacteria detected Cystitis (sis-tight-is) · Inflammation due to sexual activity can feel in urine; AND NO vaginal discharge If mild symptoms, delayed or similar to the symptoms of a UTI • UTI more likely; antibiotics should help back-up antibiotic prescription Urethra (takes urine • Some sexually transmitted infections (STIs) can You should start to improve within 48 hours plus self-care out of the body) have symptoms similar to those of a UTI • Symptoms usually last 3 days Infection or inflammation Changes during menopause in the urethra Pregnant women: Always request urine culture Some changes during the menopause can have • Urethritis (your-ith-right-is) Immediate antibiotic prescription plus symptoms similar to those of a UTI If suspected UTI self-care When should you get help? Self-care to help yourself Options to help prevent a UTI **Antibiotic resistance**

get better more quickly

- Drink enough fluids to stop you feeling thirsty. Aim to drink 6 to 8 glasses including water, decaffeinated and sugar-free drinks
- Take paracetamol or ibuprofen at regular intervals for pain relief, if you have had no previous side effects
- There is currently no evidence to support taking cranberry products or cystitis sachets to improve your symptoms
- · Consider the risk factors in the 'Options to help prevent UTI' column to reduce future UTIs

Contact your GP practice or NHS 111

The following symptoms are possible signs of serious infection and should be assessed urgently

Phone for advice if you are not sure how urgent the symptoms are:

- 1. You have shivering, chills and muscle pain
- 2. You feel confused, or are very drowsy
- 3. You have not passed urine all day
- 4. You are vomiting
- 5. You see blood in your urine
- 6. Your temperature is above 38°C or less than 36°C
- 7. You have kidney pain in your back just under the ribs
- 8. Your symptoms get worse
- 9. Your symptoms are not starting to improve within 48 hours of taking antibiotics

It may help you to consider these risk factors:

Stop bacteria spreading from your bowel into your bladder. Wipe from front (vagina) to back (bottom) after using the toilet.

Avoid waiting to pass urine. Pass urine as a soon as you need a wee.

Go for a wee after having sex to flush out any bacteria that may be near the opening to the urethra.

Wash the external vagina area with water before and after sex to wash away any bacteria that may be near the opening to the urethra.

Drink enough fluids to make sure you wee regularly throughout the day, especially during hot weather.

If you have a recurrent UTI, the following may help:

- Cranberry products and D-mannose: There is some evidence to say that these work to help prevent recurrent UTI
- After the menopause: Topical hormonal treatment may help; for example, vaginal creams
- · Antibiotics at night or after sex may be considered

Antibiotics can be lifesaving. But antibiotics are not always needed for urinary symptoms.

Antibiotics taken by mouth, for any reason, affect our gut bacteria making some resistant.

Antibiotic resistance means that the antibiotics cannot kill that bacteria.

Antibiotic resistant bacteria can remain in your gut for at least a year after taking an antibiotic.

Common **side effects** to taking antibiotics include thrush, rashes, vomiting and diarrhoea. Seek medical advice if you are worried.

Keep antibiotics working, only take them when advised by a health professional. This way they are more likely to work for a future UTI.
